With these many systems interacting and overlapping, is it possible they contribute different "components" to ADHD behaviors - and depending on where those variations occur - give rise to the different "subtypes" and symptoms of ADHD?

The rate of synthesis of those neurotransmitters in the CNS is partly dependant on the brain's availability of those precursor amino acids.

MORE AMINO ACIDS!

So we have one more link in the chain - another part in this vast and complex brain/nervous system that could break down or mis-function
